SPEC-DRIVEN DEVELOPMENT · DAY 1

AI makes code cheap.

Deciding what to build — and proving it works — isn't.

Two days. One room. Approved specs first, then GitHub Copilot builds a tested MVP.

THE CYCLE · EVERY SPEC

Specs first. Then the AI builds.

Specify → Clarify
what and why · no tech yet

G1 Client approves the spec

Plan → Tasks → Analyze
how · checked before any code

G2 Tech lead approves the plan

Build, tests first → Converge
red → green, then compare with the spec

G3 Both accept it on screen

Commit
one spec · one capability · one commit

Swipe →

THREE GATES

Three human decisions. Zero self-approval.

G1 **Is this what we want?**
The client signs the spec.

G2 **Is this a sound way to build it?**
The tech lead signs the plan.

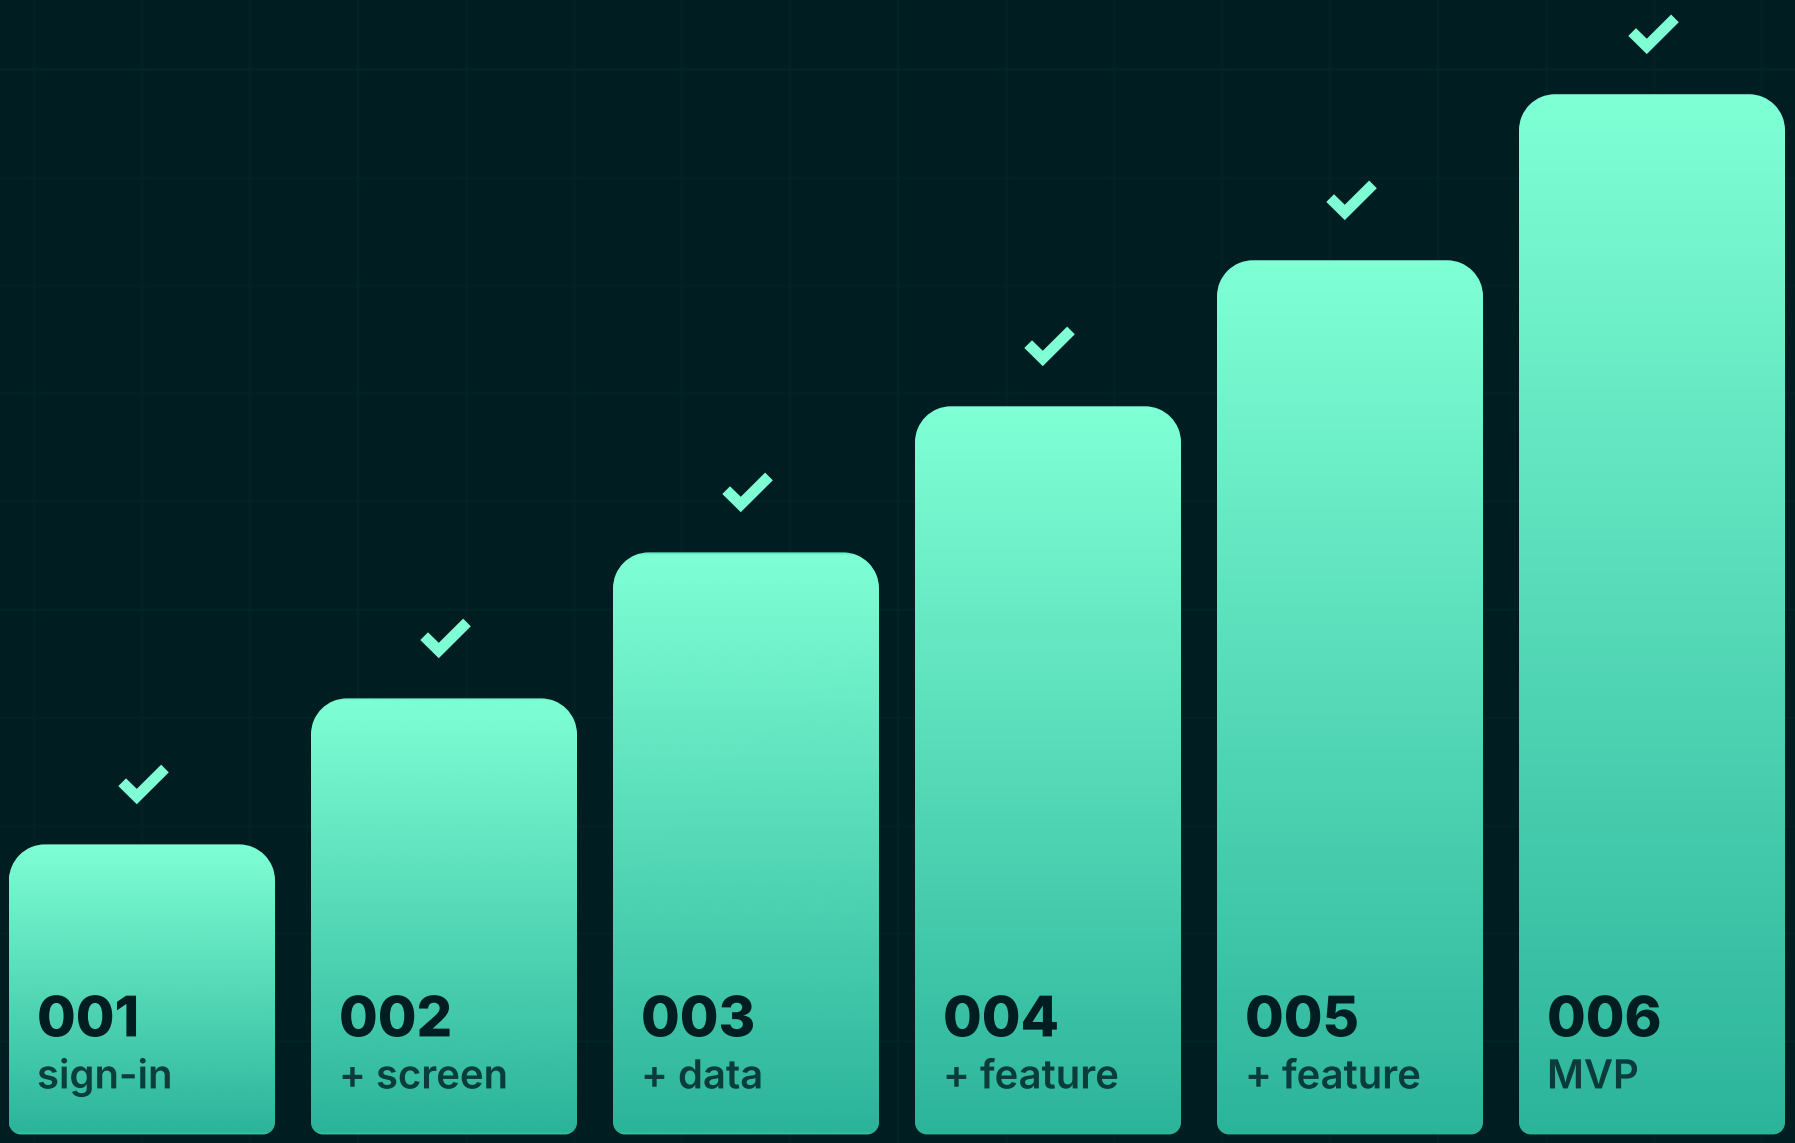

G3 **Does it do what G1 approved?**
Both accept the working feature.

> Every decision is written down. Every screen traces back to a requirement and a test.

Swipe →

INCREMENTS

Each spec builds on the last. Stop anywhere — it still works.

✓ app runs ✓ earlier tests still pass ✓ one commit

Swipe →

TOMORROW · DAY 2

From approved specs to a working, tested MVP.

```
$ uv run pytest
✓ every acceptance criterion has a test
✓ every earlier spec still passes

$ uv run python manage.py runserver
✓ the app runs, screen by screen
```

AI builds. Humans decide.
